

## Fallowland And Crop Stubble

Crop Stage	Maximum Application Rate per Acre	Directions and Timing
Idle land, postharvest to crops, or between crops	2.0 lbs. acid equivalent	Apply to emerged broadleaf weeds. For best results, treat when weeds are young and actively growing.

### RESTRICTIONS AND LIMITATIONS FOR USE IN FALLOWLAND AND CROP STUBBLE

PHI: Do not cut forage for hay within 7 days of application. Max seasonal rate: 4.0 lbs. acid equivalent per acre. Do not apply within 30 days of previous application.

PLANTING IN TREATED AREAS Labeled Crops: Within 29 days following an application of this product, plant only those crops named as use sites on this or other registered 2,4-D labels. Follow more specific limitations, if any, provided in the directions for individual crops. Labeled crops may be at risk for crop injury or loss when planted soon after application, especially in the first 14 days.

Degradation factors described below should be considered in weighing this risk. Other Crops: All other crops may be planted 30 or more days following an application without concern for illegal residues in the planted crop. However, under certain conditions, there may be a risk of injury to susceptible crops. Degradation factors described below should be considered in weighing this risk. Under normal conditions, any crop may be planted without risk of injury if at least 90 days of soil temperatures above freezing have elapsed since application. Degradation Factors: When planting into treated areas, the risk of crop injury is less if lower rates of product were applied and conditions following application have included warm, moist soil conditions that favor rapid degradation of 2,4-D. Risk is greater if higher rates of product were applied and soil temperatures have been cold and/or soils have been excessively wet or dry in the days following application.
